1. During the sexual stage, the order orthonectida of mesozoa becomes male and female which is referred to as

cell wall

cell membrane

--->> cuticle

pellicle

2. Asexual reproduction in cnideria is by

fission

fragmentation

spore formation

--->> budding

3. In platyhelmiuthes, the class trematoda can be called

tapeworm

roundworm

--->> fluke

flatworm

4. Special segment at the anterior end of the tapeworm is called

thallus

hooks

suckers

--->> scolex

5. Generally, tapeworm is enlongated and segmented and each segment is referred to as

--->> proglottis

filament

thallus

colony

6. Reproduction in the tapeworm is by _____ because its proglottides contains both male and female reproductive organs

sexually

--->> hermaphrodites

asexually

bisexually

7. In the protozoana, phylum rhizopoda can be referred to as

apicomplexa

--->> sarcodina

sarcomastigophora

ciliophora

8. One feature of rhizopoda is the possession of locomotory organelles called

--->> pseudopodia

flagella

cilia

contractral vacuole

9. The locomotory organelles found in the phylum apicomplexa is

cilia

pseudopodia

flagella

--->> none of the options

10. Flagellated cells are found in the multicellular invertebrates called

protozoa

--->> parazoa

metazoa

mesozoa
